

SCHH Landscape Glossary & Explanations

Landscape Services

⌘ Service

- **This is referred to a scheduled visit to perform any or all maintenance services.**

⌘ Mowing

- **Mowing can be referred to mowing of entire lawn.**
- **Selective mowing means that certain areas may be mowed and others may not. Circumstances to ‘not mow’ can include: areas that are too wet, recently installed sodded, or areas requested not to be mowed.**

⌘ Hard Edging

- **This is performed with every other mowing service. Areas will include: sidewalks, driveways, and patios.**
- **A stick edger with a blade is used for this tasks.**

⌘ Soft Edging

- **This is performed along landscape bed edges (mulch or pine needles) to keep a clean cut delineation between turf and bed. It also helps control encroaching turf from invading the bed.**
- **This is performed with a line trimmer or ‘weedeater’. Plastic line is used.**

⌘ Bed Weeding

- **This is performed in ‘developer installed’ beds only. Meaning, these are the original beds in front of your home that were installed at the time of construction.**
- **Performed either by hand removal or by chemical control.**

⌘ Crack Weed Removal

- **This is referred to weeds that are growing within the expansion joints of concrete; sidewalks and driveways.**
- **The removal and control process is performed by use of a line trimmer and by chemical use.**

⌘ Blowing

- **Blowing is performed after every mowing service and on occasion when mowing doesn’t occur. Areas include: sidewalks, porches, patios, and driveways.**
- **A backpack blower is utilized for this task.**

Landscape Issues

⌘ Turf Scalping

- **Defined as mowing down to bare dirt.**
- **This can have several culprits, for example:**
 - ♣ **Uneven blades on mower**
 - ♣ **Uneven topography in lawn**
 - ♣ **Straddling drainage easements**
 - ♣ **Mowing around utilities where boxes/ lids are above grade**
- **Solutions**
 - ♣ **Allow the turf to repair on its own. Typical timeline for repair: 2-3 weeks.**
 - ♣ **If necessary, re-sod the damaged areas.**

⌘ Turf Ruts

- **This is where the mower wheels sink into saturated soil leaving a depression in the lawn.**
- **Solution**
 - ♣ **Fill in with soil and re-sod**

⌘ Turf Tracking

- **This is very typical and normal especially when there are periods of rain and mowing operations occur.**
- **The ‘tracking’ is caused by dirt being picked up by the mower wheel and left on top of the grass.**
- **Does not cause any long term damage.**
- **Solution**
 - ♣ **Wash off tracks and allow the area to dry.**

⌘ Turf Insects: Mole Crickets, Army Worms, etc.

- **This is an ecological issue that is not guaranteed each year.**
- **These can be treated with a ‘contact’ insecticide which will kill the insects instantly.**
- **‘Systemic’ insecticides can be used to help provide residual protection against any potential insect issue.**

⌘ Turf Fungus (Brown Patch –most common)

- **Humidity, Heat, and Rain are contributing factors to fungus forming.**
- **Centipede turf is the most susceptible turf to have fungus during the growing season.**
- **Solutions**
 - ♣ **Apply monthly preventative fungicide treatments to help safeguard your turf.**
 - ♣ **Summit will apply a 1x application per year, if needed, to all turf areas affected by fungus. But does not include spot treatments or individual service. Summit will apply by treating all lawns.**
 - ♣ **Apply fungicides immediately upon detection. If you treat immediately, this will help stop the fungus from spreading to more areas in your lawn.**
